

Java - Hello World Program

Printing "Hello World" on the output screen (console) is the first program in Java and other programming languages. This tutorial will teach you how you can write your first program (print "Hello World" program) in Java programming.

Java program to print "Hello World"

Java program to print "Hello World" is given below:

[Open Compiler](#)

```
public class MyFirstJavaProgram {  
  
    /* This is my first java program.  
     * This will print 'Hello World' as the output  
     */  
  
    public static void main(String []args) {  
        System.out.println("Hello World"); // prints Hello World  
    }  
}
```

The screenshot shows an Excel spreadsheet with a table of products and a separate form. The table has columns for Product ID, Product Name, Category, Price, and Stock. The form has fields for Product ID and Price.

Product ID	Product Name	Category	Price	Stock
P001	Laptop	Electronics	\$50,000	15
P002	Smartphone	Electronics	\$20,000	30
P003	Blender	Kitchen	\$5,000	50
P004	Refrigerator	Appliances	\$35,000	10
P005	Microwave	Kitchen	\$10,000	20

Product ID:	P004
Price:	

Steps to Write, Save, and Run Hello World Program

Let's look at how to save the file, compile, and run the program. Please follow the subsequent steps –

- Open notepad and add the code as above.
- Save the file as **"MyFirstJavaProgram.java"**.
- Open a command prompt window and go to the directory where you saved the class. Assume it's **C:**.
- Type '**javac MyFirstJavaProgram.java**' and press enter to compile your code. If there is no error in your code, the command prompt will take you to the next line (Assumption The path variable is set. Learn: [Java Environment Setup](#)).
- Now, type '**java MyFirstJavaProgram**' to run your program.
- You will be able to see "Hello World" printed on the screen.

Output

```
C:\> javac MyFirstJavaProgram.java
C:\> java MyFirstJavaProgram
Hello World
```

Explanation of Hello World Program

As we've successfully printed Hello World on the output screen. Let's understand the code line by line.

1. Public Main Class

```
public class MyFirstJavaProgram {
```

This line is creating a new class `MyFirstJavaProgram` and being public, this class is to be defined in the same name file as `MyFirstJavaProgram.java`. This convention helps **Java compiler** to identify the name of public class to be created before reading the file content.

2. Comment Section

```
/* This is my first java program.  
 * This will print 'Hello World' as the output  
 */
```

These lines being in `/* */` block are not considered by Java compiler and are **comments**. A comment helps to understand program in a better way and makes code readable and understandable.

3. Public Static Void Main

```
public static void main(String []args) {
```

This line represents the main method that JVM calls when this program is loaded into memory. This method is used to execute the program. Once this method is finished, program is finished in single threaded environment.

4. Keywords Used

Let's check the purpose of each keyword in this line.

- **public** – defines the scope of the main method. Being public, this method can be called by external program like JVM.
- **static** – defines the state of the main method. Being static, this method can be called by external program like JVM without first creating the object of the class.
- **void** – defines the return type of the main method. Being void, this method is not returning any value.
- **main** – name of the method
- **String []args** – arguments passed on command line while executing the java command.

5. System.out.println() Method

```
System.out.println("Hello World"); // prints Hello World
```

System.out represents the primary console and its **println()** method is taking "Hello World" as input and it prints the same to the console output.
